CERTIFICATE

This is to certify that the Project work entitled **“AI Based Interior Design Visualization Tool”** is a Bonafide work carried out by Keerthi Maski (3VC23IS054) fulfillment for the award of degree of Bachelor of Engineering in INFORMATION SCIENCE AND ENGINEERING from Visvesvaraya Technological University, Belgaum, during the year 2025-2026. The mini project report has been approved as it satisfies the academic requirements in respect of project work: Mini Project (BIS586) prescribed for Bachelor of Engineering degree.

ACKNOWLEDGE

The success and final outcome of this mini project required a lot of guidance and assistance from many individuals, and I'm extremely fortunate to have received it throughout the completion of this Mini project work. Everything I have accomplished is solely due to such guidance and assistance, and I would not forget to express my gratitude to them. I would like to profoundly thank RAO BAHADUR Y MAHABALESHWARAPPA Engineering College for providing such a healthy environment for the successful completion of the Mini Project.

I would like to express my gratitude to Dr. T HANUMANTHA REDDY Principal of RAO BAHADUR Y MAHABALESHWARAPPA Engineering College, who has been a source of inspiration and has provided an amiable atmosphere to work in.

Further, I would like to extend my kind gratitude towards Dr. B SREEPATHI S HOD of the Department of Information Science and Engineering, and the entire department for providing a supportive environment for the successful completion of this project work. Also, I would like to express my deep sense of gratitude to my Mini Project coordinator, Soumya A. Associate Professor in the Department of Information Science and Engineering, for her constant support and guidance throughout the Mini Project.

It is my duty to thank all the faculty members of the information Science and Engineering Department who have directly or indirectly supported the accomplishment of the project work successfully. Last, but not least, I would like to acknowledge and thank my parents who have been a source of inspiration and instrumental in the successful completion of the Mini Project.

ABSTRACT

This Project is Interior design plays an important role in enhancing the beauty, function, and comfort of living and commercial spaces. However, the traditional visualization process requires expert knowledge, expensive software, and a significant amount of time to prepare and modify design concepts. Many people struggle to imagine the final appearance of their room before actual implementation, which sometimes leads to dissatisfaction and wastage of resources.

The **AI-based interior design visualization tool** is developed to instantly transform an ordinary room image into a professionally designed interior layout. When a user uploads a picture of their room, the system analyzes it using computer vision techniques to identify elements such as walls, furniture, windows, and lighting. After this analysis, users can select their preferred interior style—like modern, traditional, minimalist, Scandinavian, luxury, etc.—and the tool automatically renders a new visual design according to that style.

The core of the system uses deep learning and generative AI models such as Generative Adversarial Networks (GANs) or Diffusion Models. These models create realistic textures, colors, and furniture arrangements based on the user's input. The tool also allows real-time customization, enabling users to change décor elements like wall paint, flooring, lighting, and furniture positioning. The updated output is rendered quickly, giving users multiple interior design options without requiring manual sketching or specialized design skills.

This AI-driven solution provides several benefits. It significantly reduces the time and cost required for interior planning, offers realistic previews before actual implementation, and improves decision-making for users.

AI Based Interior Design Visualization Tool

INTRODUCTION

- Interior design is an essential process in creating aesthetically pleasing and functional living and working spaces. Traditionally, visualizing interior layouts involves manual sketching or the use of complex software tools, which require professional expertise, time, and high investment. Many individuals face difficulty imagining how a room will look after implementing various décor elements such as furniture, wall colors, flooring, and lighting. This uncertainty often leads to wrong decisions, increased expenses, and redesign costs. With the advancement of digital technology, the incorporation of Artificial Intelligence has provided new opportunities to simplify and enhance the design process.
- The **AI-Based Interior Design Visualization Tool** aims to solve these challenges by enabling users to visualize multiple interior design concepts automatically through artificial intelligence. The system analyzes an uploaded room image using computer vision techniques and identifies key components such as walls, windows, floors, furniture, and lighting. Based on the user's preferences, the tool applies various design styles—such as modern, minimalist, traditional, or luxury—and generates realistic interior design outputs. By using deep learning and generative AI models, the system transforms raw room images into professionally designed visual renderings within seconds.

LITERATURE REVIEW

2.1 Explanation of Literature of Reviews

- Interior design visualization with AI sits at the intersection of **scene understanding, generative image modeling, and spatial layout/furniture synthesis**. Early work focused on rule-based or optimization methods for layout and staging, but the last decade has seen deep learning replace handcrafted pipelines: convolutional networks and specialized architectures now do room layout estimation, semantic segmentation, and object detection from single images or panoramas, providing the geometric scaffold that downstream generators need.
- Modern approaches include monocular room layout estimators that predict corners, wall planes and floor segmentation, enabling accurate 3D-aware re-rendering and object insertion.
- Automatic detection and segmentation of furniture and structural elements (walls, windows, doors, floors) is critical for controlled editing. Methods reuse family models (e.g., YOLO variants for object detection and FCN/UNet variants for semantic segmentation) adapted to indoor scenes and even to 2D floor plans.
- These detectors are paired with geometric post-processing (vanishing point detection, perspective transforms) to register objects correctly in the room coordinate frame — a necessary step for believable virtual staging or furniture replacement.

Looks for AI Based Visualization of Tools

- **Speed, convenience and variety:** Many reviews note that AI tools dramatically cut down the time needed for generating design ideas. Where traditional rendering or manual layout takes hours or days, AI-based tools can generate visualizations (3D renders, style-transformed rooms, layout proposals) in minutes or even seconds.
- **Easy experimentation with multiple styles / ideas:** Users appreciate being able to try different design styles (modern, minimalist, cozy, luxury, etc.) quickly — without needing deep design knowledge.
- **Accessible to non-experts, reduces barriers:** People who lack design training find AI-based tools as friendly entry-points: they can upload a simple photo of their room and get a decorated visualization.
- **Good for brainstorming, mood-boarding, early planning:** Many designers and real estate professionals use AI-generated visuals as preliminary drafts — to present ideas to clients, compare different design directions, or as first-cut visuals before more detailed planning.

ANALYSIS & DESIGN

3.1 Analysis of AI Based Interior Design

- **AI improves design speed** by generating interior layouts and styles within seconds compared to manual sketching and CAD modelling.
- **Visualization becomes more accessible** for non-experts, allowing homeowners and students to design spaces without professional skills.
- **Future potential is huge**, with expected enhancements through AR/VR, 3D simulations, product-catalog mapping and voice-based design control.

3.2 List of Analysis of AI Based Interior Design :-

1. Feasibility Analysis

- **Purpose:** To determine whether the project is practical and achievable within constraints like cost, time, resources, and technology.
- **Focus Areas:**
 - **Technical feasibility:** Availability of AI models, computer vision tools, and rendering frameworks.
 - **Operational feasibility:** Ease of use for homeowners, students, or designers.
 - **Economic feasibility:** Cost-effectiveness compared to hiring professional designers or using traditional software.
- **Outcome:** Confirms that developing an AI-based visualization tool is viable and beneficial.
 - on and intuitive interface design.
 - User satisfaction and usability for non-experts.

2. Performance Analysis

- **Purpose:** To evaluate the efficiency, speed, and quality of the tool.
- **Metrics Considered:**
 - Rendering speed for design outputs.
 - Realism and accuracy of AI-generated visuals.
 - System stability under different room sizes and complexity.

3. Technical Analysis

- **Purpose:** To examine the technical requirements and architecture of the system.
- Key Considerations:
 - Image processing and segmentation (OpenCV, deep learning models).
 - Generative AI models for style transformation (GANs, diffusion models).
 - Backend and frontend integration for real-time rendering.
 - Hardware and software requirements to ensure smooth operation.

4. Operational Analysis

- **Purpose:** To analyse how the system will be used and the workflow for users.
- Focus Areas:
 - User interaction flow from image upload → style selection → design preview → customization.
 - Ease of navigation and intuitive interface design.
 - User satisfaction and usability for non-experts.

5. Performance Analysis

- **Purpose:** To evaluate the efficiency, speed, and quality of the tool.
- Metrics Considered:
 - Rendering speed for design outputs.
 - Realism and accuracy of AI-generated visuals.
 - System stability under different room sizes and complexity.

6. Cost-Benefit Analysis

- **Purpose:** To compare the cost of using AI visualization tools versus traditional design methods.
- Benefits:
 - Reduced design cost.
 - Faster generation of multiple design options.
 - Accessibility for a wider audience.

7. Limitations & Risk Analysis

- **Purpose:** To identify potential shortcomings or risks.
- Key Points:
 - AI may generate designs that are visually appealing but technically inaccurate.
 - Limited realism in certain lighting or furniture arrangements.
 - Privacy risks if room images are stored improperly.

Implementation

Key implementation methods

- ❖ **Generative AI**: Users can upload a photo of a room and the AI will generate multiple design ideas, such as different furniture arrangements, styles, and color palettes. These tools can also take custom requests for materials, furnishings, and more.
- ❖ **Augmented Reality (AR) and Virtual Reality (VR)**: AI-powered AR/VR tools allow designers and clients to experience a design in a 3D, immersive environment. This helps in visualizing furniture placement and other elements to provide real-time feedback on changes.
- ❖ **Automated task completion**: AI can automate repetitive design tasks, such as creating 2D/3D floor plans, optimizing furniture layouts, and selecting materials based on user preferences.
- ❖ **Personalized recommendations**: AI analyzes user input and design data to provide personalized recommendations for furniture, decor, and color schemes that align with client preferences and current trends.
- ❖ **Rapid rendering**: These tools can generate photorealistic 3D renderings and high-quality visualizations in minutes, a process that traditionally takes much longer.
- ❖ **Data-driven insights**: AI can analyze large datasets to help designers understand current trends and forecast future ones, leading to more informed decisions about styles and materials.
- ❖ **Style and mood inspiration**: AI can help users explore different styles by fusing influences from inspiration images or by providing a list of pre-defined design styles to choose from.
- ❖ **Error reduction**: By detecting spatial inconsistencies and improving layout logic, AI can help reduce the chance of human error in the design process.

Step-by-step guide

1. Choose an AI tool:

Select from a variety of platforms, such as Canva, ArchiVinci, Planner 5D, or Midjourney. Some are designed for professionals, while others are user-friendly for beginners.

2. Upload an image:

Take a clear photo of your room or upload an existing floor plan. For best results, ensure the image is high-quality and shows the space as clearly as possible.

3. Provide a text prompt:

Describe what you want to achieve. Be as specific as possible by using design terminology to guide the AI, for example, "bedroom with floor-to-ceiling box molding" instead of "a wall detail".

- Mention the desired style (e.g., minimalist, vintage, modern).
- Specify elements you want included (e.g., "light wood flooring," "colorful furniture," "large ceiling light fixture").
- Mention colors and materials you like or dislike.

4. Generate and refine designs:

The AI will generate several design options based on your input.

- Review the suggestions and see which ones align with your vision.
- If you don't like the results, refine your prompt with more specific details and regenerate.
- For many tools, you can also use image editing features to tweak elements like furniture placement and colors.

5. Explore and customize:

Once you have a design you like, you can often view it in different formats.

- Switch between 2D and 3D views to better understand the layout.
- Use VR walkthroughs for a more immersive experience.
- If the design is for a client, you can export it to show them your vision.
- You can use the final design for inspiration, a discussion point, or as a direct basis for your project.

Testing

1. Using AI for Visualization Testing (Visual AI Testing)

Visual AI testing leverages artificial intelligence and machine learning to automate the process of verifying a software's user interface (UI) and user experience (UX).

- ❖ **Functionality:** Instead of manual pixel-by-pixel comparisons, Visual AI tools "see" the application like a human eye would, identify meaningful changes, and distinguish between a genuine bug (e.g., misaligned button) and an intended design change (e.g., a color update).

Key Features of Tools:

- ❖ **Visual Regression Testing:** Compares current screen snapshots against a stored "baseline" version to detect visual discrepancies across various browsers, devices, and viewports.
- ❖ **Self-Healing Automation:** AI automatically adjusts test scripts when UI elements change (e.g., an element's position or locator shifts), reducing test maintenance effort.
- ❖ **Natural Language Processing (NLP):** Allows testers to write or generate test cases in plain English, making automation accessible to non-technical users.
- ❖ **Root Cause Analysis:** Provides detailed reports with screenshots and videos, and uses AI to pinpoint the exact code (CSS/DOM) differences causing a failure.

3. Testing of AI-Based Data Visualization Tools

These are Business Intelligence (BI) platforms that use AI to simplify data analysis and dashboard creation for a wide range of users, not just data scientists.

- ❖ **Testing Focus:** When testing these applications, the focus is on the accuracy, reliability, fairness, and performance of the underlying AI models, in addition to standard software testing principle. **Key Testing Considerations:**
- ❖ **Data Quality Checks:** Ensuring the training and testing data is complete, accurate, consistent, and free of bias, as biased data leads to unfair or incorrect AI output.
- ❖ **Model Validation:** Assessing the AI model's ability to predict outcomes accurately on unseen data and ensuring it has learned underlying patterns rather than random data.
- ❖ **Explainability (XAI):** Validating how the AI arrives at specific insights or recommendations to build trust and ensure compliance with ethical standards.
- ❖ **Performance and Scalability:** Testing the tool's efficiency and speed when processing massive datasets and handling complex tasks.

Tool is used for AI testing

Tool	Best For	Key AI Feature
BrowserStack	Test observability	AI root cause analysis
Testim	Reducing flaky tests	ML-powered locators
LambdaTest KaneAI	LLM-powered	Natural language tests
TestResults.io	No selectors	Selector-free testing

RESULTS & DISCUSSION

Results of AI in Interior Design

AI tools have delivered tangible results across various stages of the design process:

- **Accelerated Ideation and Visualization** AI tools can generate multiple design variations and photorealistic 3D renders in seconds or minutes, a process that traditionally took days of manual work. This speed allows for rapid brainstorming and exploration of diverse styles, from minimalist to rustic, providing instant inspiration.
- **Enhanced Client Experience and Collaboration** The use of augmented reality (AR) and virtual reality (VR) in AI platforms allows clients to virtually "walk through" and experience a proposed design before any physical changes are made. This immersive experience improves communication, helps manage client expectations, and facilitates more informed decision-making.
- **Optimized Space Planning** AI algorithms can analyze room dimensions and functional requirements to suggest optimal furniture layouts and space utilization, which is especially helpful for small or awkwardly shaped rooms.
- **Increased Accessibility and Cost-Effectiveness** AI makes interior design more accessible to homeowners and small businesses who may not have the budget to hire a professional designer. Many tools offer free or affordable subscription models, enabling a "do-it-yourself" approach.

- **Data-Driven Decisions** AI can analyze vast datasets of design trends, color psychology, and spatial patterns to provide designers with valuable insights and personalized recommendations tailored to user preferences.

Discussion and Limitations

- ✚ While the results are promising, several key discussion points and limitations exist:
- ✚ **Lack of Human Touch and Emotional Intelligence** The primary limitation noted across various studies is AI's inability to fully replicate a human designer's empathy, intuition, and personal touch. Human designers can understand the personal stories, emotions, and unique lifestyles of clients in a way data-driven algorithms cannot, leading some AI designs to feel "impersonal".
- ✚ **Technical Constraints and Inaccuracies** AI tools are still evolving and can produce glitches or "artifacts," such as distorted furniture or inconsistent scaling. They may also struggle with complex structural constraints like load-bearing walls or local building codes, requiring professional oversight for real-world application.
- ✚ **Creativity vs. Automation Balance** A significant discussion centers on AI as a collaborative tool versus a replacement for human creativity. The most effective approach appears to be a balanced one, where designers use AI as a *creative assistant* for ideation and automation, allowing them to focus on high-level artistic vision, problem-solving, and client relationships.
- ✚ **Data Dependency and Bias** AI performance is heavily reliant on the quality and diversity of its training data. Biases in the data can lead to a homogenization of design or a lack of cultural sensitivity.
- ✚ **User Learning Curve** While many tools aim for user-friendliness, professional-grade software can still present a steep learning curve for technical users.

Future Prospects

The future of AI in interior design is focused on collaboration and enhanced capabilities:

1. Continued advancements in machine learning and natural language processing will lead to even smarter and more intuitive tools.
2. Integration with smart home technology and e-commerce platforms could streamline the entire process from design to purchasing.
3. The industry will likely see a blend of human expertise and AI efficiency as the standard, leveraging the strengths of both to create functional, innovative, and deeply personal spaces.

Outcomes for AI-Based Interior Design

The application of AI in the field is expected to yield the following outcomes:

- **Streamlined Workflows:** The design process, from conceptualization to execution, will become more seamless and efficient, allowing designers to focus on high-value creative tasks.
- **Greater Accessibility:** AI tools make professional-level design more accessible to a wider audience, including non-designers and small businesses, through user-friendly interfaces and cost-effective options.
- **Emergence of New Job Roles:** The industry will see the rise of new specializations, requiring designers to have strong technology skills to effectively integrate and manage AI tools within the design process.
- **Sustainable Design Solutions:** AI can contribute to more eco-friendly practices by optimizing material usage, suggesting sustainable materials, and designing for energy efficiency (e.g., smart lighting/climate control).

CONCLUSION AND FUTURE WORK

Conclusion

The mini project on the AI-Based Interior Design Visualization Tool demonstrates how artificial intelligence can effectively enhance the interior design process by offering fast, accurate, and realistic space visualization. The system provides users with automated design suggestions by analyzing room type, size, style preferences, and colour combinations. This reduces the dependence on manual design drafting and helps users visualize the final look of a space before applying changes in real life.

The tool proves beneficial for designers, homeowners, and architects, allowing them to explore multiple design possibilities in a cost-effective and time-saving manner.

Overall, the project highlights that AI-driven visualization can make interior design smarter, more interactive, and more efficient.

Future Work

Although the current system achieves its intended objectives, there is still scope for improvement and expansion. The following points outline possible future enhancements:

- ❖ Integrating **Augmented Reality (AR) and Virtual Reality (VR)** to allow users to experience 3D interior walkthroughs in real-time.
- ❖ Expanding the **database of furniture models, materials, and colour palettes** to support a wider range of design choices.

- ❖ Adding **budget-based design options**, where the system suggests interior layouts based on cost preferences. □
- ❖ Introducing **automatic room measurement and object detection** using smartphone camera input for improved accuracy.
- ❖ □ Providing **smart optimization** features that recommend designs based on space saving, lighting improvement, and ergonomics.
- ❖ □ Deploying the tool as a **mobile and web application** for multi-platform accessibility.
- ❖ □ Implementing **user feedback learning**, so the system improves its design recommendations based on user selections over time.
- ❖ □ Enable **AI learning from user feedback** to continuously improve design recommendations.
- ❖ □ Option to **connect with online furniture stores**, enabling users to purchase suggested décor items directly.

The screenshot shows a web browser window with the URL `C:/Users/Koushalya/Desktop/sonu/KRISHNA.html`. The page features a form titled "AI Design Generator" with the following elements:

- A "Choose file" button with the text "No file chosen".
- A "Choose Room Type" dropdown menu.
- A "Choose Style" dropdown menu.
- A text input field with the placeholder "Add something specific (optional, e.g., wall art, sofa, lamp)".
- A "Generate Design (Demo)" button.

Below the form is a "Feedback" section with:

- A "Your Name" input field.
- A "Share your feedback here..." text area.
- A "Submit Feedback" button.

The browser's taskbar at the bottom shows the system time as 10:41 AM on 30-11-2025.
